## PROFESSIONAL EXPERIENCE

**Devhawk/Fraction, Atlanta Ga**  
Forward Deployed Engineer

March 2026 – Present

### *SOC2 compliant SaaS platform for Registered Investment Advisors (RIAs)*

TypeScript · Node.js · Express · Drizzle ORM · PostgreSQL · React · Vite · React Native (Expo) · Azure (Container Apps, Blob Storage, Key Vault) · Bicep · Docker

- Hardened daily custodian data ingestion across Schwab, Altruist, and Raymond James by building pipelines that decrypt PGP-encrypted SFTP files, parse and normalize custodian data, and load it into PostgreSQL.
- Improved reliability and type safety across a large PostgreSQL data model by maintaining the schema and migration workflows with Drizzle ORM.
- Improved cross-custodian data consistency and client-account matching by standardizing transaction types and using Realtime APIs to resolve unmatched accounts.
- Identified previously hidden data integrity issues by reconciling platform records against a legacy wealth-management system, uncovering discrepancies in holdings, security classifications, symbols, quantities, and account values.
- Enabled compliant digital document execution by implementing e-signing workflows with append-only audit trails, PDF processing, document hashing, and immutable signature records.
- Automated document processing and AI-assisted workflows using Azure OpenAI, Azure Document Intelligence OCR, and Anthropic Claude batch APIs while hardening untrusted inputs against prompt-injection attacks.
- Owned features end to end from implementation through production release, validating acceptance criterion across local, staging, and production environments through API-level testing, AI browser-based verification, and recorded walkthroughs.

### *Commercial Laundromat Chain*

TypeScript · Next.js 16 (App Router) · Drizzle ORM · PostgreSQL 16 · Better Auth · BullMQ + Redis/Valkey 7 · Zod · shadcn/ui + Tailwind v4 · DigitalOcean

- Architected a multi-app monolith using Next.js route groups six independently themed, access-controlled apps (Operations, Executive, CRM, Marketing, Legal, Admin).
- Designed a normalized financial data pipeline that ingests Square (POS), Xero (GL/accounting), and ConnectTeams (payroll) data.
- Built an FP&A forecasting engine with a cascade projection model, versioned forecast snapshots (draft → submitted → approved), variance analysis, and per-store/per-month P&L visibility driven by a 55-row Chart of Accounts.
- Implemented a store-level P&L system sourcing actuals from Xero GL transactions and future periods from the forecast cascade, with role-scoped financial visibility controls.
- Built multi-pipeline ticketing (maintenance, store-ops, finance, legal, admin, marketing, integration) with escalation, routing teams, and technician assignment.
- Engineered background job infrastructure on BullMQ/Redis for external syncs and long-running tasks with idempotent sync logging, retry handling, and outbound webhook events (machine.offline, sync.completed).
- Implemented org-based access control via Better Auth organizations + a custom role/permission matrix and per-store assignment scoping.
- Added operations tooling: machine monitoring & alerting (auto-flag machines offline >48h), maintenance tracking and store layout.
- Owned features end to end from implementation through production release, validating acceptance criterion across local, staging, and production environments through API-level testing, AI browser-based verification, and recorded walkthroughs.

### *Full-Stack Legal Operations Platform*

Python · FastAPI · SQLAlchemy · Alembic · Next.js · TypeScript · PostgreSQL · AWS CDK

- Built a settlement packet generator that assembles a 10-document signature packet from live case data by building a configurable packet engine that dynamically selects affidavits, adjusts claimant-specific language, and renders PDFs with pdf-lib
- Enabled configurable claimant intake workflows without application code changes by building a database-driven form runtime supporting conditional questions, deceased-claimant branching, validation, file uploads, and workflow-triggered case advancement
- Delivered secure, versioned storage for campaign documents by provisioning an encrypted S3 bucket with AWS CDK, prefix-scoped IAM through EKS OIDC, and validated presigned uploads that verify object keys and file existence before persistence.
- Unified 3 communication channels into a single matter timeline by migrating the Communications Log to a new client-engagement model combining Customer.io messages, SMS, and legacy call-to-action records with source-aware permissions for vendor and operator-generated entries.
- Added audience duplication to a Segment Engage-backed campaign builder.
- Delivered rich-text matter notes with zero measured layout shift by implementing a Tiptap/Markdown editing system with shared styling between edit and read views and scroll-anchored expansion and collapse for long notes.
- Owned features end to end from implementation through production release, validating acceptance criterion across local, staging, and production environments through API-level testing, AI browser-based verification, and recorded walkthroughs.

### *Roofing marketplace SaaS*

TypeScript · Next.js 15 (App Router) · React 19 · Tailwind CSS · Supabase (Postgres + Auth + RLS + Storage) · Vercel

- Took over engineering support for a client-built replacement application, implementing changes and resolving defects as it moved toward production.
- Contributed to a roofing estimate engine applying manufacturer-specific formulas for multi-pitch area breakdown, material quantities, waste factors, tax resolution, and contractor markup, with live supplier pricing merged over a static catalog without redeploy.
- Shipped an AI-powered competitor quote-comparison flow: homeowners upload a competitor PDF/image, an OpenAI Vision backend extracts line items and pricing, and the UI surfaces markup/scope findings handling 20–40s async analysis with custom timeout logic.
- Contributed to admin tooling: a drag-and-drop pipeline Kanban, DB-driven pricing configuration (live shingle enable/disable), campaign management with typed execution gates, and referral payout workflows.
- Migrated application data from GCP to Supabase, handling a technical transition the client could not complete independently.
- Ran recurring security reviews using the team's Claude-based audit workflow, investigated findings, and fixed confirmed vulnerabilities.
- Updated CLAUDE.md with project-specific development and security guidance based on issues found during those reviews.

**Devhawk/Fraction, Atlanta Ga**

August 2025 – March 2026

*AI Software Engineer*

TypeScript · Node.js · Zod/OpenAPI · Next.js · React · Tailwind CSS · Radix UI · Drizzle ORM · PostgreSQL (Supabase) · Clerk · Stripe · OpenAI/LangChain · pnpm + Turborepo · Vercel

- Delivered a production-grade developer analytics platform integrating 4+ engineering and collaboration systems by building a multi-tenant FastAPI/Next.js application with PostgreSQL, Row-Level Security, JWT authentication, and permission-based access controls.
- Enabled extensible integrations across Jira, GitHub, Linear, Slack, and Microsoft Teams by building a typed plugin framework with OAuth 2.0 authentication, secure token management, webhook ingestion, resource-discovery APIs, rate limiting, and exponential-backoff retries.
- Automated developer analytics and integration synchronization by implementing distributed Celery workers with configurable scheduling, concurrent execution limits, progress tracking, and failure recovery.
- Enabled AI-powered code review, developer analytics, outreach, and story-point estimation by orchestrating specialized CrewAI agents with configurable prompts, tool selection, role-based permissions, and autonomous task execution.
- Supported multiple LLM providers with resilient execution and cost visibility by building a LiteLLM abstraction layer with OpenAI and Anthropic failover, rate limiting, token tracking, performance monitoring, and cost analysis.
- Secured multi-tenant application data across 3 permission levels—system admin, organization admin, and member by combining PostgreSQL Row-Level Security, and Clerk JWT authentication.
- Improved database reliability and deployment safety by implementing SQLAlchemy transaction management, connection pooling, query optimization, and Alembic migration validation with CI/CD-enforced single-head migrations.
- Automated application testing and deployment by containerizing PostgreSQL, TimescaleDB, Redis, and application services with Docker Compose and implementing GitHub Actions pipelines for testing, linting, migration validation, and deployment.

**Fraction, Atlanta Ga**

August 2024 – August 2025

*Software Consultant*

- Developed and managed companies internal ATS and Proposal Generation platform utilizing Typescript, React, CSS, Supabase, REST API's, Postgres
- Coordinated weekly sprint planning and backlog refinement sessions in Asana, driving on-time delivery with 98% ticket completion and ensuring alignment with project deadlines.
- Managed 1,500+ inbound client inquiries, coordinating technical needs and developer requirements to ensure timely responses and advance opportunities through the sales pipeline.
- Built and optimized marketing automations in utilizing custom code solutions, Webflow, GHL, and N8N.
- Improved developer sourcing and screening by engineering LLM prompts that transformed resume data into structured developer profiles for faster candidate evaluation and team matching.
- Automated developer-to-project recommendations by leading an AI initiative using Fireflies.ai meeting transcripts to extract technical requirements and identify qualified developers based on client needs.
- Contributed to 3× revenue growth within 6 months by sourcing and assembling engineering teams aligned with client technical and delivery requirements.
- Increased sales-cycle velocity by 60% by designing automations across sales and developer sourcing workflows, reducing manual handoffs and accelerating candidate-to-client matching.
- Advised clients on technical architecture and implementation strategies, translating business requirements into recommended engineering approaches and team compositions.

**Exchange(startup), Atlanta, Ga**

January 2023– August 2023

*Full Stack Developer*

- Developed a mobile application for both IOS and Android platforms utilizing React Native, ensuring a consistent user experience across devices.
- Collaborated with cross-functional teams using modern UI/UX principles to design, develop, and maintain Exchange's mobile applications, ensuring a user-friendly experience.
- Architected and integrated user authentication services, bolstering application security and user data protection measures.
- Maintained version control with Git, streamlining code management and enhancing team collaboration through efficient tracking of code changes and project evolution.
- Actively contributed to software architecture design meetings, providing valuable insights and innovative solutions that influenced the architectural decisions, ensuring scalability, maintainability, and performance of Exchange's software solutions.

**Macy's, Johns Creek, GA**

May 2022 – August 2022

*Software Engineer Intern*

- Played a pivotal role in a diverse, international team of 9, driving the development and continuous enhancement of a User Interface web application through expert applications of JavaScript, TypeScript, and React.
- Engaged in detailed code reviews with both supervisors and peers fostering a culture of excellence in code quality and functionality.
- Spearheaded optimization initiatives that dramatically reduced future developer hours by 500%.
- Enhanced interdepartmental collaboration by working closely with various teams, significantly improving the efficiency of API calls and fostering a more integrated development environment.
- Acquired and applied expertise in Agile and Scrum methodologies, contributing to the team's ability to adapt to changing requirements and expedite product delivery.
- Effectively demonstrated the ability to communicate complex technical concepts to executive-level management through compelling stories and presentations, demonstrating exceptional communication skills and strategic insight.

**University Of Georgia Research Foundation, Athens, GA.**

August 2021 – March 2022

*IOS App Developer Intern*

- Contributed to the UGA Pre-Professional Planner, an iOS app helping students track experiences and prepare for professional-school applications.
- Improved user experience through iterative development, user feedback, and usability testing.
- Implemented journaling features for documenting experiences used in applications, personal statements, and interviews.
- Built Firebase data persistence and synchronization for user activity and journal data.
- Developed dynamic interfaces tailored to students' selected pre-professional tracks.
- Built data-entry workflows for maintaining structured histories of undergraduate experiences.
- Implemented Excel-compatible data exports for professional-school application preparation.

**EDUCATION****The University of Georgia**

Degree: Bachelor of Science: Computer Science
